

Web UI

Overview

All UI-related items should be hosted in Vercel.

By doing so, we do not have to worry or deal with things such as property caching, redundancy, or even creating a deployment pipeline. Vercel also gives us "preview deployments" for free, which makes testing and reviewing PRs significantly easier.

This stack would apply to any web UI we need to create (other than the public website)

Suggested tools and technologies

- NextJS as the framework (which is based on React) configured as a Progressive Web App (PWA)
- TypeScript throughout
- Axios + ReactQuery (aka TanStack Query)
- MUI as the base component library
 - We can always create a custom theme on top of this
- SCSS + CSS modules for styles
- State management
 - Zustand for global state management (if needed)
 - Context API for local state mgmt
